HydraPlusin

Hydra+Numpy

Conclusions

Francesco Bertolotti

Università degli Studi di Milano,
Computer Science Department

T-LADIES Kick-off, Pisa, July 6th 2022

Joint work with Walter Cazzola

Motivation

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

Libraries are one of the most important components of the language ecosystem.

Motivation

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

Library development takes years of community work. For example:

- Numpy development lasted more than 15 years.
- Pytorch development lasted more than 5 years.

Motivation

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

Library development takes years of community work. For example:

- Numpy development lasted more than 15 years.
- Pytorch development lasted more than 5 years.

Libraries are available only for a handful of languages. For example:

- Numpy is available only for Python and C.
- Pytorch is available only for Python and C.

Motivation

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

Library development takes years of community work. For example:

- Numpy development lasted more than 15 years.
- Pytorch development lasted more than 5 years.

Libraries are available only for a handful of languages. For example:

- Numpy is available only for Python and C.
- Pytorch is available only for Python and C.

Libraries from different languages have inconsistent interfaces. For example:

- Python random module handles more distributions than Java Random.
- Python pytorch module has a softmax method, dl4j (Java) does not.

Motivation

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

Language-Independent Libraries may bring few benefits.

- Available for several languages and potentially new ones.
- Consistent interface between languages.
- Bigger user base: bugs get caught faster.

Problem statement and proposed solution

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra
HydraKernel
HydraTemplate
HydraPlugin
Hydra+Numpy

Conclusions

Problem: Library availability is language dependent

Objective: Rendering library availability language independent with a transpilation infrastructure.

Hydra

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

Hydra is a **one-to-many, source-to-source**, transpilation infrastructure.

- **one-to-many**: One source language is translated to several target languages.
- **source-to-source**: The code of a source language is transcribed into the target language equivalent.

Hydra is designed for language-independent library development.

Hydra Components

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

There are three main components in the Hydra architecture.

- **HydraKernel**: the source language.
- **HydraTemplate**: the target language definition mechanism.
- **HydraPlugins**: the extension mechanism for HydraKernel.

HydraKernel

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

HydraKernel is a subset of the Scala language.

It supports:

- types: int, float, boolean, void (unit in Scala), string, pointer to the previous.
- arithmetic operations: Addition, subtraction, multiplication, power, and division for int and float types.
- logical operations: and, or, and not on Booleans types.
- type conversion: int-to-string, float-to-string, int-to-float.
- string operations: concatenation, length, and equality
- Control-flow statements: if, if-else, and while-do.
- Basic object-orientation abstraction such as classes.

HydraKernel

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

BubbleSort wrote in HydraKernel.

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

```
var i: Int = 0
var j: Int = 0
while ( i < array.size) {
  while ( j < array.size) {
    if(array(j) > array(j+1)) {
      swap(array,i,j)
    }
  }
}
```

HydraKernel

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

HydraKernel BUBBLESort translated in Python.

```
i = 0
j = 0
while i < array.__len__():
    while j < array.__len__():
        if array[j] > array[j + 1]:
            swap(array, i, j)
```

HydraKernel BUBBLESort translated in C++.

```
int i = 0;
int j = 0;
while (i < array.size()) {
    while(j < array.size()) {
        if(array[j] > array[j + 1]) {
            swap(array, i, j)
        }
    }
}
```

Code Conditioning Directives

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

If needed, HydraKernel supports code conditioning directives (CCD).

CCDs are preprocessing directives expressed through comments.

CCDs can change the code generation according to language features.

Code Conditioning Directives

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

```
/* IF STATIC_ARITH */  
def add(op1: T, op2: T): T = return new T(add_(op1,op2))  
def sub(op1: T, op2: T): T = return new T(sub_(op1,op2))  
def mul(op1: T, op2: T): T = return new T(mul_(op1,op2))  
def div(op1: T, op2: T): T = return new T(div_(op1,op2))  
/* ELSE */  
def add(op: T): T = return new T(add_(T.this.value,op))  
def sub(op: T): T = return new T(sub_(T.this.value,op))  
def mul(op: T): T = return new T(mul_(T.this.value,op))  
def div(op: T): T = return new T(div_(T.this.value,op))  
/* ENDIF */
```

HydraKernel

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

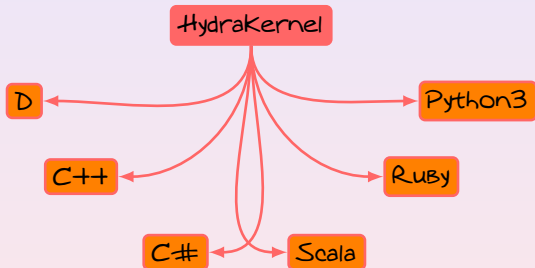

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

HydraTemplate

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

HydraTemplates are one component of the extension mechanism of Hydra.

HydraTemplates define language features in a declarative manner.

HydraTemplate

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra
HydraKernel
HydraTemplate
HydraPlugin
Hydra+Numpy

Conclusions

By overriding:

```
def while_do(cond: String, body: String) :  
    String = s"while $cond:\n${indent(body)}\n"  
  
def if_def(cond: String, body: String) :  
    String = s"if $cond:\n${indent(body)}\n"
```

- It specialize the while_do pattern for Python language.
- It specialize the if_def pattern for Python language.

HydraTemplate

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

HydraTemplates should be application independent.

HydraTemplates can be specialized through inheritance.

Inherited HydraTemplates can be application-dependent.

HydraPlugin

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

HydraPlugins are the second component of the extension mechanism.

HydraPlugins are made of two components:

- An HydraModule.
- A LanguageModule.

For example, HydraBase is the HydraPlugin responsible for HydraKernel core language features such as while-loops and if

HydraPlugin

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

HydraPlugins can be used to add new features to the HydraKernel Language.

HydraTemplates specialize the pattern for a given language.

HydraBase Module

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

The HydraModule is responsible for identifying nodes of interest in the HydraKernel AST.

For example,

```
def translate(tree: Tree, parent_tree: Tree): String = {  
  tree match {  
    // ...  
    case If(condition, block, Literal(Constant(()))) =>  
      lang.if_def(condition, end_block(block))  
    // ...  
  }  
}
```

It uses Scala internals to identify if_def nodes.

It translates the nodes using the HydraModule.

HydraBase Language

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

The HydraLanguage is responsible for transcribing nodes of interest into target language strings.

For example,

```
// ...  
def while_do(cond: String, body: String): String  
def if_def(cond: String, block: String): String  
// ...
```

while_do and if_def are completely delegated to HydraTemplates.

HydraNativeCalls Plugin

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

HydraNativeCalls plugin is responsible for handling the Foreign Function Interface (FFI).

Its HydraModule identifies any extension to the `com.sun.jna.Library`.

Its HydraLanguage transcribes classes extending `com.sun.jna.Library` to the target language equivalent.

HydraNativeCalls Module

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

```
abstract override def translate(tree: Tree, parent_tree: Tree): String = {  
  // ...  
  tree match {  
    // ...  
    // if class extends com.sun.jna.Library  
    case ClassDef(_, name, List(), Template(List(parent), _, native_funs))  
      if parent.toString == "com.sun.jna.Library" =>  
      // transcribe class into FFI eqv for target language  
      // ...  
  }  
}
```

HydraNativeCalls Language

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

NativePlugin needs to know how a null pointer in the target language is declared.

```
// ...  
val null_pointer_value: String  
/// ...
```

A LanguageTemplate fills the language-dependent knowledge. For example the Python3 template:

```
// ...  
val null_pointer_value: String = "None"  
// ...
```

Hydra Workflow

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

1. Develop the library with any language.
2. Expose a C API for your library.
3. Write bindings using HydraKernel.
4. Translate the bindings to any language.
5. If needed use add new templates or new plugins.

Case study: Numpy

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

Numpy is a popular library for scientific computing.

Numpy is available only for Python and C.

We would like to have a Numpy-like library for other languages.

MiniNumpy

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

MiniNumpy is a Numpy subset written in HydraKernel.

MiniNumpy builds upon Numpy and Python C API.

We ported MiniNumpy for:

- D,
- C++,
- C#,
- Scala,
- Ruby,
- Python3.

MiniNumpy

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlugin

Hydra+Numpy

Conclusions

MiniNumpy supports:

- Some array allocation routines: `arange`, `linespace`, `zeros`, and `ones`.
- Some array manipulation routines: `reshape`, `repeat`.
- Some array operations: addition, subtraction, division, and multiplication.
- And, classic indexing routines.

MiniNumpy HydraKernel

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

```
object Numpy {  
  // ...  
  def zeros(shape:Array[NativeInt], type:Int): NpyArray = {  
    return new NpyArray(c_zeros((new Shape(shape)).getPointer(),  
                                type.toNativeInt))  
  }  
  def ones(shape:Array[NativeInt], type:Int): NpyArray = {  
    return new NpyArray(c_ones((new Shape(shape)).getPointer(),  
                               type.toNativeInt))  
  }  
  // ...  
}
```

MiniNumpy Generated

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

MiniNumpy for C++.

```
NpyArray zeros(std::vector<int> shape, int nptype) {  
    return (NpyArray(c_zeros(Shape(shape).getPointer(), nptype)));  
}  
NpyArray ones(std::vector<int> shape, int nptype) {  
    return (NpyArray(c_ones(Shape(shape).getPointer(), nptype)));  
}
```

MiniNumpy for Python.

```
def zeros(shape, nptype):  
    return NpyArray(c_zeros(Shape(shape).getPointer(), nptype))  
def ones(shape, nptype):  
    return NpyArray(c_ones(Shape(shape).getPointer(), nptype))
```

MiniNumpy Mandelbrot

Hydra:
Language
Independent
Library
Development

Francesco
Bertolotti

Motivation

Hydra

HydraKernel

HydraTemplate

HydraPlusin

Hydra+Numpy

Conclusions

MiniNumpy Mandelbrot in Python

```
size = 1024
x = np.linspace(-2, 1, size, np.FLOAT64)
    .reshape((1, size))
    .repeat(size,0)
y = np.linspace(-1, 1, size, np.FLOAT64)
    .reshape((size, 1))
    .repeat(size,1)
c = x+np.complex_(0,1)*y
z = np.zeros((size, size), np.COMPLEX128)
m = np.ones((size, size), np.BOOLEAN)
for i in range(100):
    z[m] = z[m] * z[m] + c[m]
    m[z.abs() > np.float_(2.0)] = np.bool_(False)
```
